

Ethical AI: Four Considerations for Your Organization

Consider This: 82% of nonprofits use AI, but only 10% have formal policies. These four considerations close that gap.

- ❑ **1. Bias and Equity** — AI models reflect training data biases. Content generated for your populations may carry implicit assumptions about race, class, or family structure. Review all AI outputs through an equity lens.
- ❑ **2. Transparency and Disclosure** — 92% of donors say nonprofits should disclose AI use. Be open about when and how AI assisted in creating documents, proposals, and communications.
- ❑ **3. Human Oversight** — Every AI output must be reviewed by a qualified human before use. This is especially critical for case notes, participant communications, and documents involving vulnerable populations.
- ❑ **4. Accuracy and Verification** — AI presents all information with equal confidence regardless of source quality. Verify every statistic, citation, and factual claim against primary sources before including in professional documents.
