

Protecting Your Data: Privacy and Non-Disclosure

Consider This: 77% of AI interactions at work involve real company data. Before you type, ask: “Would I be comfortable if this appeared in a search result?”

- ❑ **1. Training Data Risk** — On free and consumer tiers, your prompts and uploads may be used to train the AI model. Never enter personally identifiable information (PII) — participant names, SSNs, case numbers, or addresses — into free-tier AI tools.
- ❑ **2. Cloud Storage and Data Retention** — Even with “temporary chat” enabled, data is stored on the provider’s servers for up to 30 days. Shared conversations have been indexed by search engines, exposing donor details and personal stories.
- ❑ **3. Document Uploads and Knowledge Bases** — When you upload organizational documents (curricula, intake forms, program data), they are processed and stored by the AI provider. Ask before uploading: “Does this contain PII, proprietary content, or information covered by a non-disclosure agreement?”

Rule: Treat every AI prompt as if it could be made public. Use pseudonyms or anonymize data before entering it.
